Original Business Plan Highlights

People seek guidance around specific life events and decisions. Consultations can be episodic, and detailed chart software takes time to learn.

Lead with a question a user already has, such as how to plan a career move or what to consider before taking a relationship forward.

June plan pp. 5-8

A calculated birth chart, divisional charts, planetary periods, and transits give the reading a specific basis. The research workflow applies those inputs to the user's question.

Calculate the chart before AI interpretation. Show the relevant evidence, and use practitioner review to test the interpretation.

June plan pp. 7-8, 21-23

User goals and earlier conversations can make follow-ups more relevant over time. Topic dashboards give users a starting point.

The signed-in app showed Self, Love, and Work. Lead with Self's newer design, with Love and Work next. User-selected card topics, card-aware follow-ups, and response modes are in development.

June plan pp. 8, 22-23

Distribution can start with high-intent questions, educators, and diaspora communities. Timing gives people a recurring reason to use the product.

Free Panchang timing gives users a reason to return between bigger decisions. Test whether a timing visit leads to a second visit and then a focused chat.

June plan pp. 17-19, 22-23

Long-horizon planning can keep the product useful beyond a single session.

Life Reading is in development. Expand into private Life Projects for a trip, promotion, business launch, engagement, or wedding, with boards, milestones, timing windows, and follow-ups.

June plan pp. 18, 22-23, 28-29

Consumer revenue comes first. Compatibility, practitioners, and embedded distribution can expand the business later.

Test US subscriptions and India question purchases and dashboard unlocks. Measure recurring revenue separately from purchases. Partner APIs follow consumer evidence and partner demand.

June plan pp. 25-30

Figures and Claims to Reconcile

The original financing proposal was $1M-$1.5M in preferred equity (pp. 3, 30-31). The original six-month targets were 750 payers and about $12K MRR (pp. 19-20), equivalent to $16 per active subscriber. Treat these as historical plan assumptions. The revised commercial milestone is $100K MRR, or $1.2M annualized recurring revenue.

The original uses competing market counts (cover, pp. 2 and 13), question allowances and prices (pp. 2 and 16), and Year 3 subscriber counts (pp. 14 and 26). Its six-month 750 payers and 10,000 registrations imply 7.5% if measured with the same denominator, while its assumption says 5% (pp. 19-20, 25).

The original modeled $290 LTV and $20 blended diaspora CAC, a 14.5x ratio under those inputs (pp. 3, 17). The Year 3 revenue mix includes other revenue lines while the projection is also described as subscription-only (pp. 26, 29). Build a new model from regional pricing, cohort retention, discounts, platform fees, and service costs.

Practitioner validation is a future milestone (pp. 21-23). Verify chart computation and evaluate interpretation quality separately. Treat dated competitor valuations, acquisition scenarios, and inferred life-event advertising (pp. 14, 21, 31-33) as historical proposals outside the base case. For advertising, study contextual placements by region and voluntarily chosen broad interests.
